# JORDAN DAUDU

Software Engineer Student

972-(054)-250-8121 jordandaudu@gmail.com LinkedIn Portfolio GitHub

## SUMMARY

I am a Software Engineering student at SCE with strong skills in Python, Java, and C#. Experienced in OOP, data structures, and problem-solving. Fast learner, adaptable, and motivated to write clean, efficient code while exploring new technologies. I am skilled with GitHub, Jira, and system design.

Eager to gain industry experience and contribute to real-world software projects.

## EDUCATION

### Bachelor of Science (B.S.) in Software Engineering Candidate

**SCE - Shamoon College of Engineering**

09/2023 - Present

- Rector-President's Award for Excellence
- Certificate of Excellence for High Entrance Scores
- German Israeli Autumn School Exchange Program Participation Certificate
- Score as of the end of year two: 95

### P.Eng - Practical engineer in Electronics and Computer Engineering

**ORT Colleges**

09/2019 - 06/2021

- Studies in the Electronics and Computers major and received a certificate in Electronics and Computers Engineering - Electronic Systems.
- Final score: 95.

### Technological Diploma

**ORT**

2016 - 2019

- Full technological diploma that includes 10 units in electronics and computers major

## PROJECTS

### Nomad Protocol: AETERRA (Unity/C#)

https://github.com/JordanDaudu/Unity-Project-Nomad-Protocol-Aeterra-Showcase

https://nomad-protocol-aeterra.onrender.com/

**In active development.**
Developing a modular top-down 3D shooter in Unity and C#, with a strong focus on scalable gameplay architecture and clean system separation. Built systems for pooled projectiles and impact effects, modular weapons, and enemy AI behaviors for melee and ranged combat using animation-event-driven timing. Designed the project to support long-term iteration, maintainability, and engineering documentation through a dedicated devlog / archive site.

### Dungeons & Dragons-Inspired Java Game

https://github.com/JordanDaudu/Dungeons_And_Dragons

Designed and developed a feature-rich co-op RPG in Java as part of an Advanced OOP course. Implemented grid-based gameplay, class-based combat, enemy behaviors, inventory systems, save/load support, global world events, and support for up to 4 local players. Applied object-oriented design, polymorphism, multithreading, and data-structure-driven game logic to build a scalable and maintainable game architecture.

## EXPERIENCE

### Research Assistant

**SCE - Shamoon College of Engineering**

09/2025 - 10/2025

*Worked as a Research Assistant at SCE on a biological data analysis project focused on predicting the age of flies based on movement tracking data. Took over an existing Fly Tracking project and developed a deep learning model using PyTorch to analyze motion-based CSV data and estimate fly age groups. Implemented several model iterations, added new biologically relevant features, optimized training performance, and collaborated closely with biology researchers to ensure meaningful data interpretation and reliable results.*

- Took ownership of an existing Fly Tracking AI project, extending and improving its machine learning pipeline.
- Developed and trained deep learning models (RNN-based) using PyTorch to analyze time-series motion data from CSV outputs (x, y coordinates).
- Engineered and integrated biologically relevant features to improve model accuracy and interpretability.
- Collaborated closely with biology researchers, translating biological insights into machine learning features and validating results against known age labels.

## SKILLS

### Programming Languages / Tools

Java | Python | C++ | C# | GDScript | HTML | PostgreSQL | Git | GitHub | Replit | AI

### General Skills

Teamwork | Critical Thinking | Time Management | Algorithms | Data Structures | Object-Oriented Programming

## LANGUAGES

| Hebrew | English | French |
|---|---|---|
| Native | Proficient | Proficient |

# PROJECTS

## Fly Tracking AI

https://github.com/JordanDaudu/FlyTrackerDataLearning

Built a deep learning research project in Python using PyTorch to classify fly age into 7 groups from time-series trajectory data. Developed a hybrid neural network combining a Bidirectional LSTM with Attention Pooling and a statistical summary branch and worked with biology researchers to incorporate biologically relevant features and improve model interpretability.

---

## Event & Staff Management Platform

https://github.com/JordanDaudu/EventStaffManagementSystemShowcase

Built a full-stack event staffing management platform for multi-hall scheduling, role-based workflows, smart staffing calculations, and responsive Hebrew RTL dashboards. Developed the system using Replit and structured AI prompting as part of the development workflow, while refining application logic, data flows, authentication, and UI behavior across React, Next.js, Node.js, Express, PostgreSQL, Prisma, and JWT.

---

## Notion Stock Tracker

https://github.com/JordanDaudu/NotionStockTracker

Built a Python automation tool that scrapes live stock and fund prices from Globes and syncs them to linked Notion pages through the Notion API. Implemented Selenium and BeautifulSoup-based scraping with a fallback approach for reliability, plus configurable single-run and continuous polling modes, CSV price history logging, and change-detection logic to skip unnecessary updates.
